DOLAP Workshop

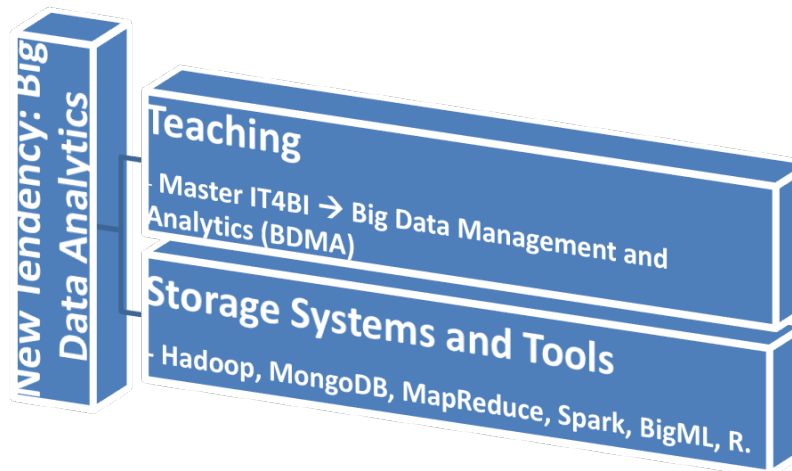

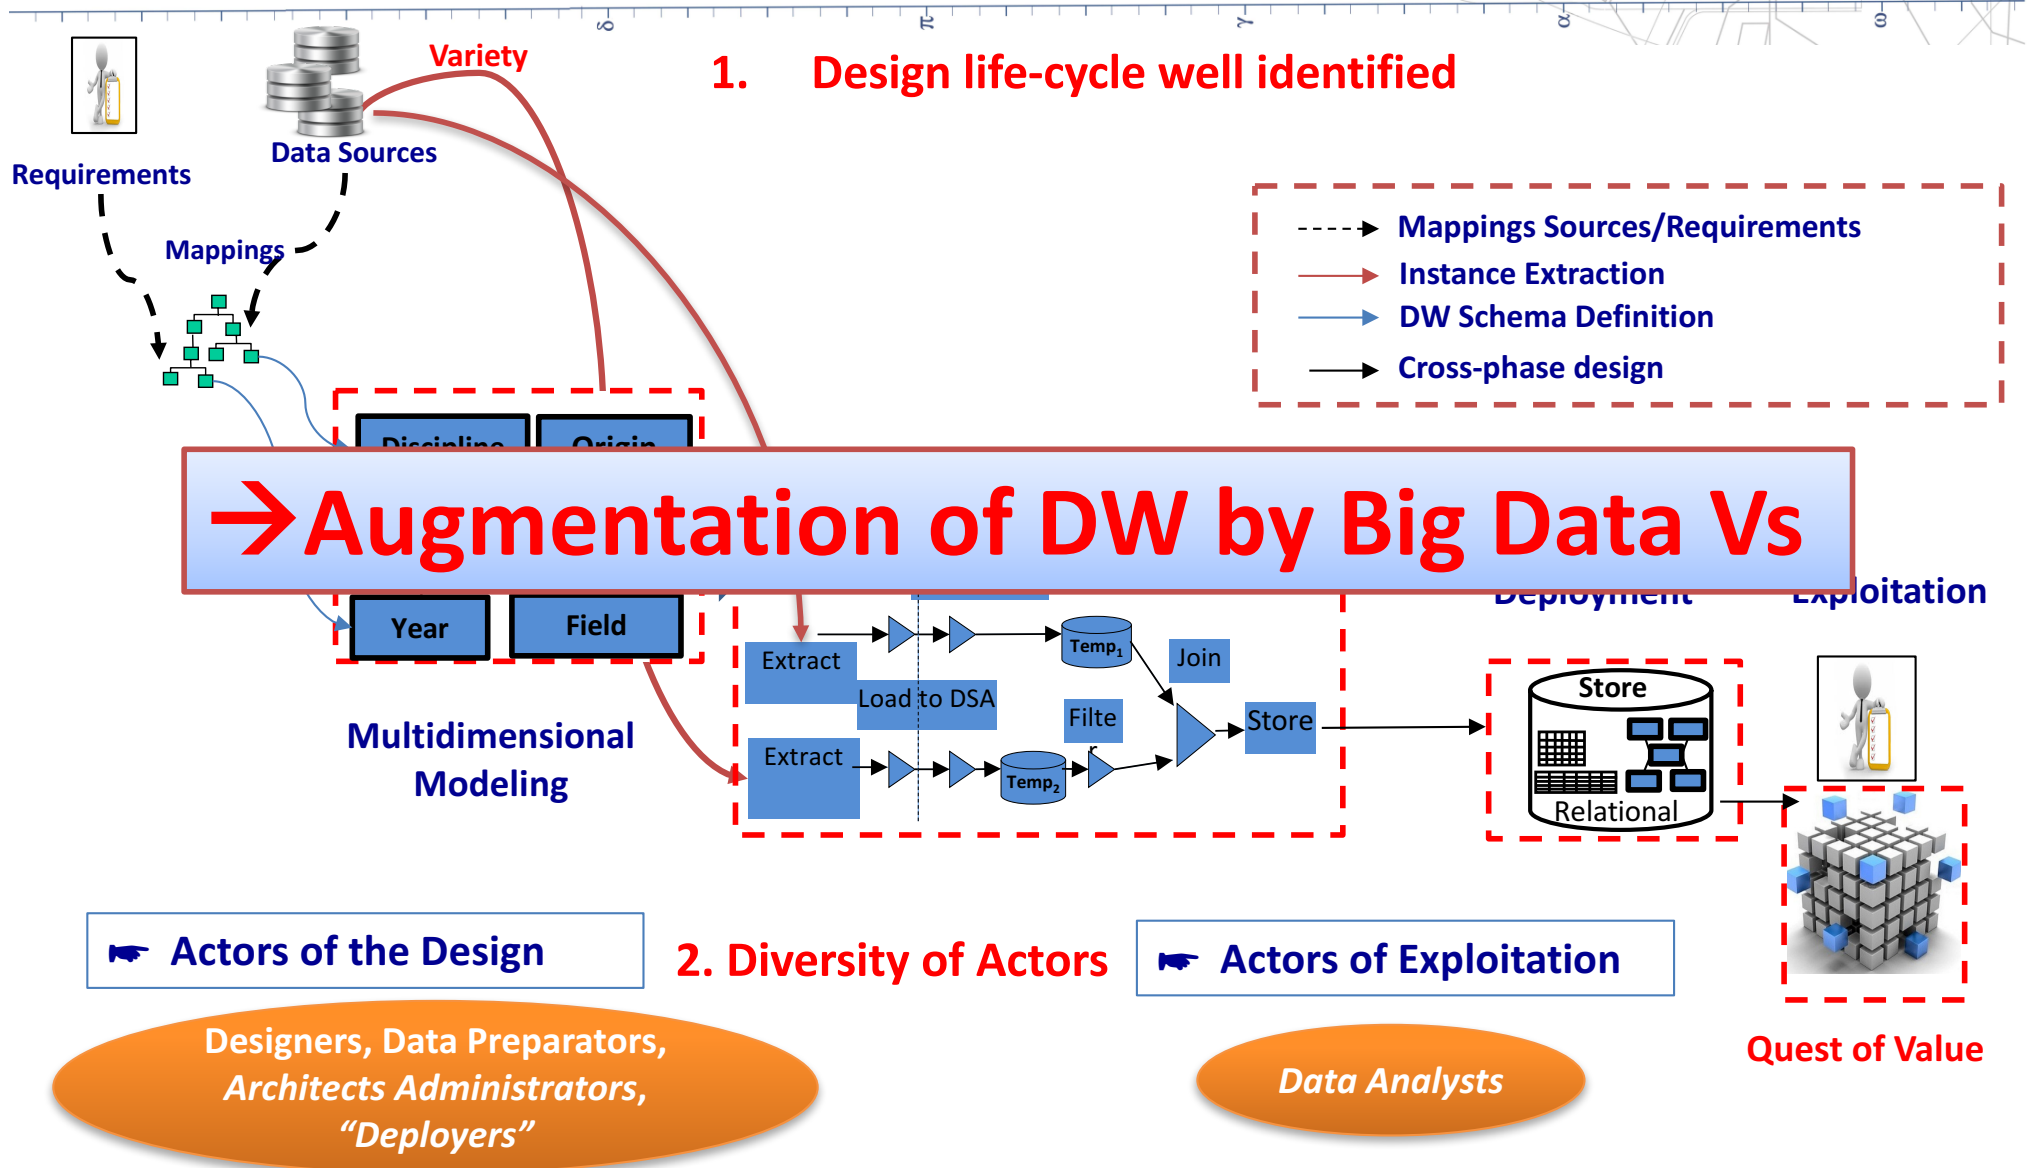

1998-2015

2016: Thinking

2017-Present

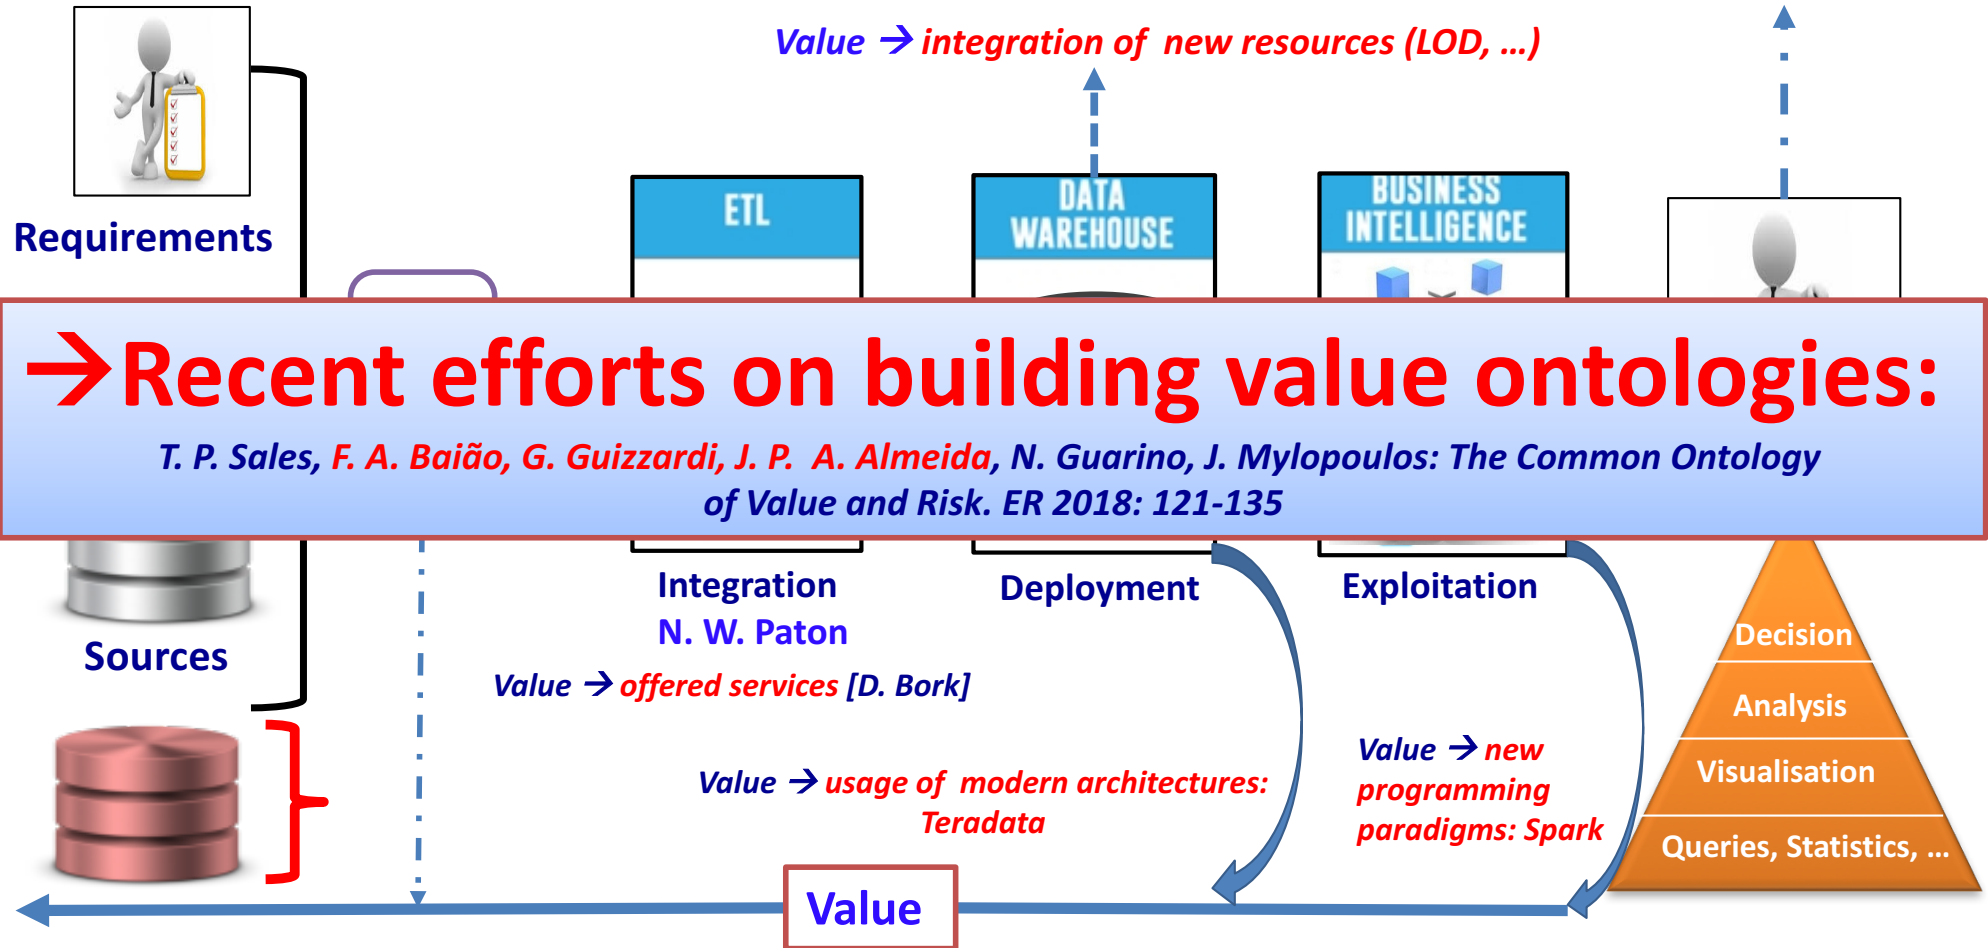

- Value & Variety (2Vs)
- Augmenting DW by Linked Open Data
- 2Vs-driven Design Approach
- Case Study
- Summary

- FR: Value → **money** [A. G. Sutcliffe'2018]
- NfR: Value → **satisfaction of qualities** (security, privacy, ...)

Value → **user feedback:**
N. Konstantinou

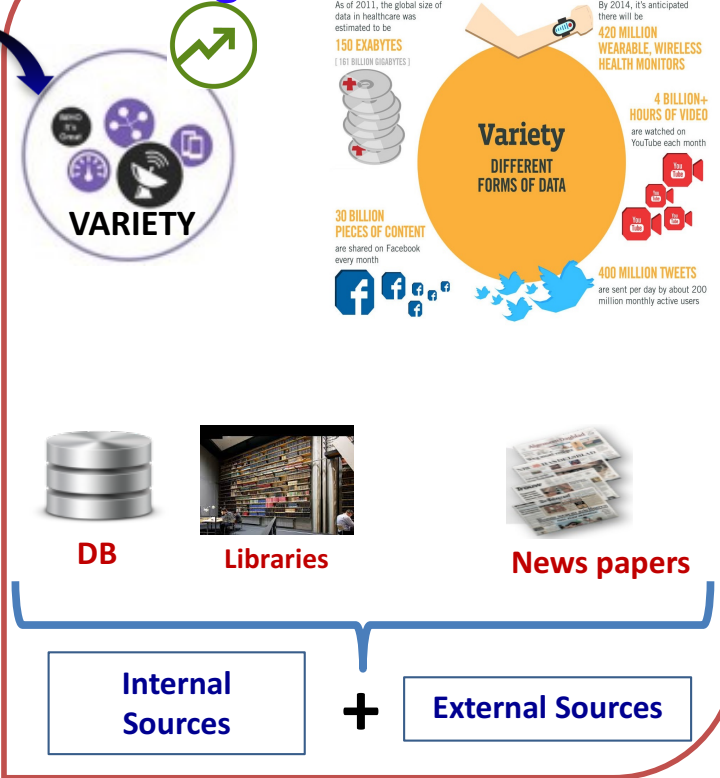

→ **interdependencies** between value (phases) & value (operational DW)

Person in Charge (PiC) of Value

- ❑ Examples of requirements related to value¹ :
 - *Media: Has the coverage of media changed over time?*
 - *Politics: Speeches EU parliament that contain « human rights » by country*
 - *Finance: Evolution of Debates related to Greece crisis by country*
- ❑ Measurement of the value **depends** on the studied domain
- ➔ Interaction between designers and PiC of value: **multidisciplinary** in DW

Designer

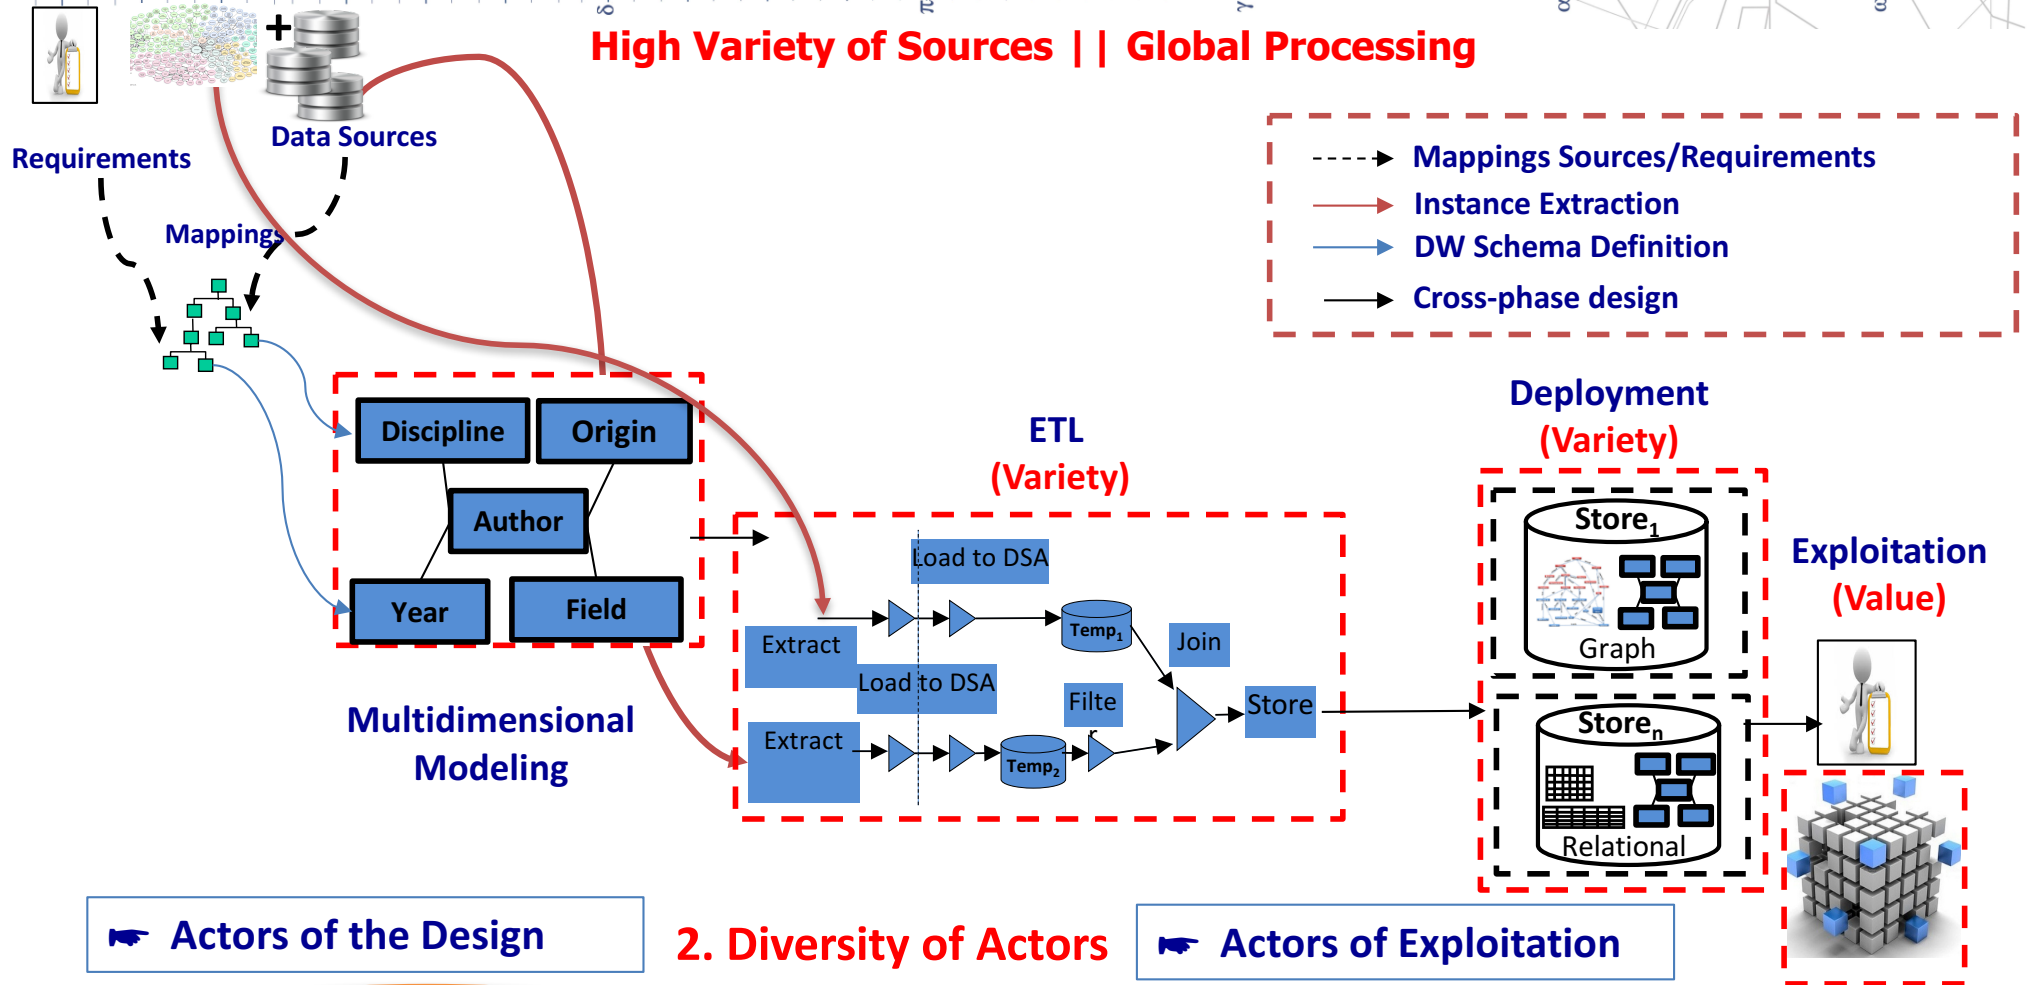

➔ Usage of Linked Open Data :

- **Traditional Management of Variety**
- +
- **Variety of Formalisms (graphs)**

¹<http://www.talkofeurope.eu/data>

□ Inputs:

1. Set of internal sources: $S_{Int} = \{S_{I1}, S_{I2}, \dots, S_{Im}\}$
2. Set of external resources: $S_{Ext} = \{S_{E1}, S_{E2}, \dots, S_{En}\}$
3. Each source (internal/external) S_i has:
 - Its own physical format (F_i)
 - Its conceptual model CM_i
 - Is related to a discipline D (medicine, engineering, etc.)
4. Set of requirements to be satisfied
5. [Optional]: An **operational** DW ([Ravat et al. 2017]), where:
 - Its conceptual model CM_{DW}
 - Its format(s) $Format(S_{DW}) = \{f_1, f_2, \dots, f_k\} \rightarrow$ polystore storage

□ Objective:

- Definition of all phases of DW augmenting its value

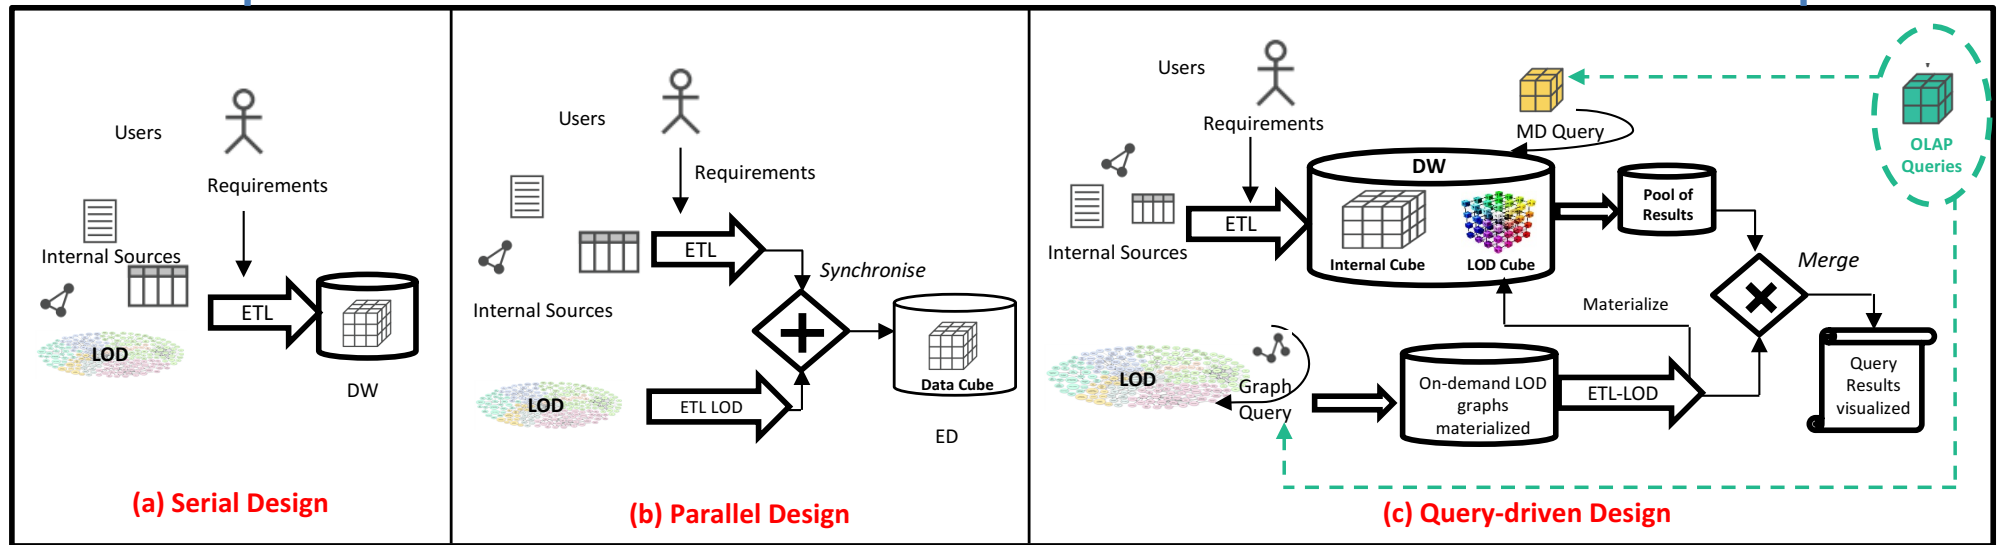

□ Challenges:

- Metrics of Value

$$Value(DW) = \text{Operator}_{(1 \leq i \leq n+m)} [Weight(S_i, D) * Value(S_i)]; S_i \in S_{int} \cup S_{ext} \text{ [Ballou et al.]}$$

3 Scenarios

LOD is seen as source

Two Parallel ETL

On-demand ETL: data extracted from the existing DW and LOD, then potentially loaded into DW → (requirement satisfaction)

Challenges?

1. **Pivot schema** : generic schema vs. LOD schema (graph)
2. **Redefinition** of operators (**overloading**)
3. **Synchronisation** of internal and external data: 3 scenarios

Value(DW) = Operator_(1 ≤ i ≤ n+m) [weight(S_i, D) * Value(S_i)], where S_i ∈ S_{int} ∪ S_{Ext}

□ Three metrics related to:

1. Requirement satisfaction

$$Value(Req, S_i) = \frac{\text{number of responses of requirement on } S_i}{\text{number of responses of all requirements}}$$

2. Conceptual modelling (multidimensional concepts)

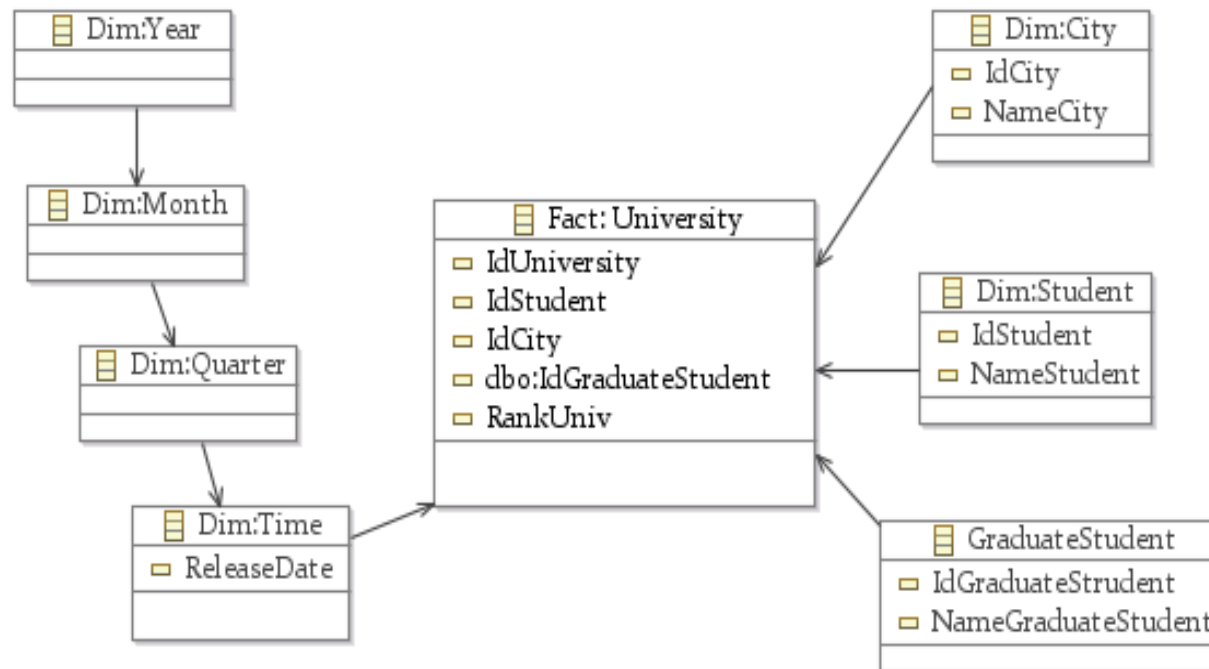

$$Value(Concepts, S_i) = \frac{\text{number of concepts of DW schema by integrating } S_i}{\text{total number of the DW concepts}}$$

3. Target DW population

$$Value(Instances, S_i) = \frac{\text{number of instances of DW by integrating } S_i}{\text{total number of instances of the DW}}$$

University Research Analysis

- 4 internal sources generated from LUBM benchmark
- 15 initial requirements

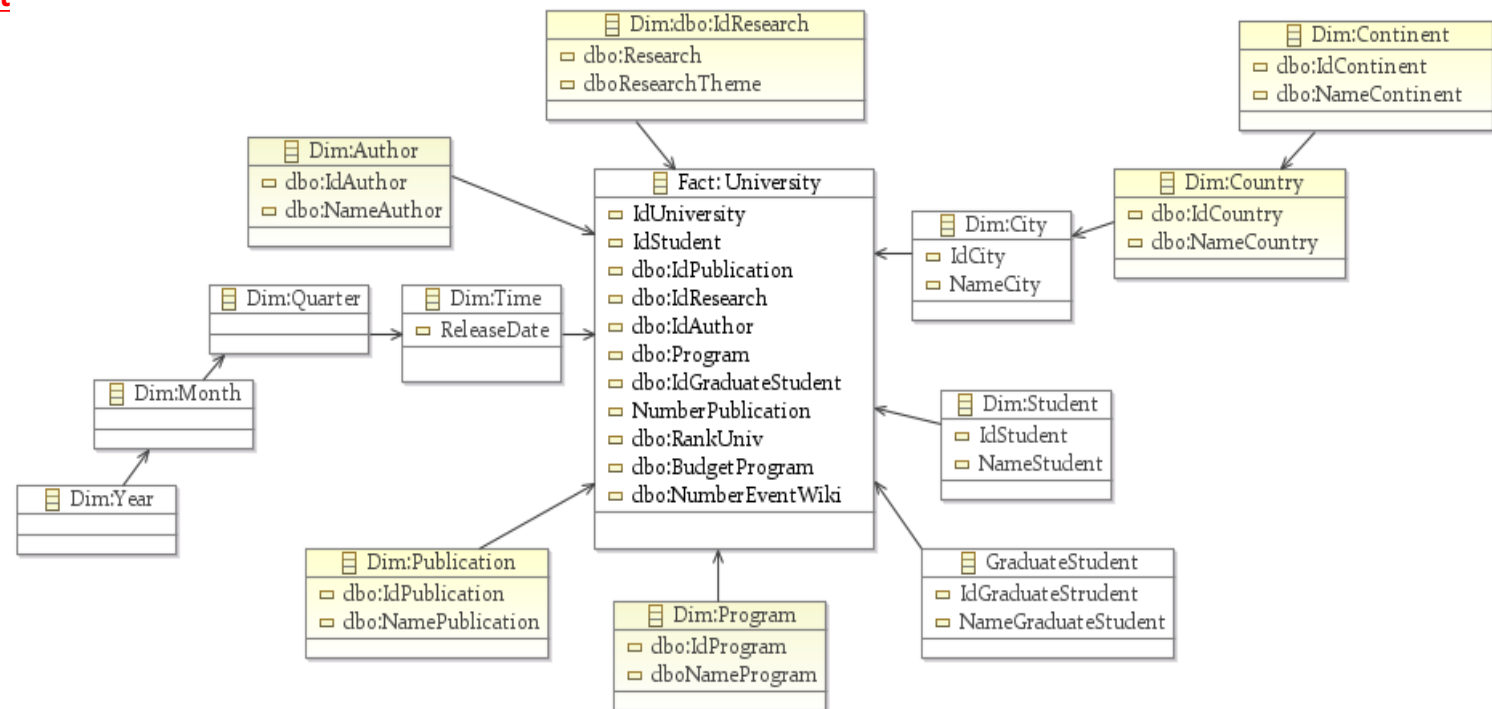

Analysis:

- 6 requirements are not satisfied by internal sources (Oracle 12c release 1)
 → External source: Dbpedia

Metrics Sources	Dimensions/ Measures	Value (S*) _{MD}	Value(S*) _{Req.}	Value (S*) _{Instances}	Instances	Response time
Internal Sources	6/1	31%	6%	10%	550K	1.1
Serial Design	10/7	71%	80%	94%	7,7x10 ⁶	3.2
Parallel Design	11/8	73%	84%	85%	3,1x10 ⁶	2.6
Query-driven design	12/8	74%	96%	84%	2,9x10 ⁶	1.7

*All sources have the same weight

*Operator: Avg

- ✓ 2Vs for the DW renaissance
- ✓ Value = pool of multidisciplinary expertise
- ✓ DW life cycle design revisited (new formalization)
- ✓ 3 augmented scenarios
- ➔ Veracity & 2V
- ➔ More automation (query rewriting)
- ➔ Value Query Language (Thank Patrick)
