>>> Plan
```

1. Managing Memory

- Kernel space memory layout

- User space memory layout

- Process memory map

- Swap

- Swap to compressed memory (zram)

- mtrace

- Valgrind

- Additional reading

>>> Kernel space memory layout

- * The kernel itself, in other words, the code and data loaded from the kernel image file at boot time. This is shown in the preceding code in the segments .text, .init, .data, and .bss. The .init segment is freed once the kernel has completed initialization.
- * Memory allocated through the slab allocator, which is used for kernel data structures of various kinds. This includes allocations made using kmalloc(). They come from the region marked lowmem.
- * Memory allocated via vmalloc(), usually for larger chunks of memory than is available through kmalloc(). These are in the vmalloc area.
- * Mapping for device drivers to access registers and memory belonging to various bits of hardware, which you can see by reading /proc/iomem. These come from the vmalloc area but since they are mapped to physical memory that is outside of main system memory, they do not take any real memory.
- * Kernel modules, which are loaded into the area marked modules.
- * Other low level allocations that are not tracked anywhere else.

Listing 1: Listing

```
#include <stdio.h>
#include <stdlib.h>
#include <string.h>
#include <sys/resource.h>
#define BUFFER_SIZE (1024 * 1024)
void print_pgfaults(void)
{
int ret;
struct rusage usage;
ret = getrusage(RUSAGE_SELF, &usage);
if (ret == -1) {
perror("getrusage");
} else {
printf ("Major page faults %ld\n", usage.ru_majflt);
printf ("Minor page faults %ld\n", usage.ru_minflt);
}
}
```

>>> User space memory layout II

```
int main (int argc, char *argv[])
{
    unsigned char *p;
    printf("Initial state\n");
    print_pgfaults();
    p = malloc(BUFFER_SIZE);
    printf("After malloc\n");
    print_pgfaults();
    memset(p, 0x42, BUFFER_SIZE);
    printf("After memset\n");
    print_pgfaults();
    memset(p, 0x42, BUFFER_SIZE);
    printf("After 2nd memset\n");
    print_pgfaults();
    return 0;
}
```

>>> User space memory layout III

Initial state

Major page faults 0

Minor page faults 172

After malloc

Major page faults 0

Minor page faults 186

After memset

Major page faults 0

Minor page faults 442

After 2nd memset

Major page faults 0

Minor page faults 442

>>> Process memory map

```
cat /proc/1/maps
```

```
00008000-0000e000 r-xp 00000000 00:0b 23281745 /sbin/init
00016000-00017000 rwxp 00006000 00:0b 23281745 /sbin/init
00017000-00038000 rwxp 00000000 00:00 0 [heap]
b6ded000-b6f1d000 r-xp 00000000 00:0b 23281695 /lib/libc-2.19.so
b6f1d000-b6f24000 --p 00130000 00:0b 23281695 /lib/libc-2.19.so
```

1. r = read
2. w = write
3. x = execute
4. s = shared
5. p = private (copy on write)

>>> Swap

The idea of swapping is to reserve some storage where the kernel can place pages of memory that are not mapped to a file, so that it can free up the memory for other uses. It increases the effective size of physical memory by the size of the swap file. It is not a panacea: there is a cost to copying pages to and from a swap file which becomes apparent on a system that has too little real memory for the workload it is carrying and begins disk thrashing.

```
>>> Swap to compressed memory (zram)
```

- * CONFIG_SWAP
- * CONFIG_CGROUP_MEM_RES_CTLR
- * CONFIG_CGROUP_MEM_RES_CTLR_SWAP
- * CONFIG_ZRAM

```
>>> mtrace I
```

Listing 2: Listing

```
#include <mcheck.h>
#include <stdlib.h>
#include <stdio.h>
int main(int argc, char *argv[])
{
    int j;
    mtrace();
    for (j = 0; j < 2; j++)
        malloc(100); /* Never freed:a memory leak */
        calloc(16, 16); /* Never freed:a memory leak */
    exit(EXIT_SUCCESS);
}
```

```
>>> mtrace II
```

```
export MALLOC_TRACE=mtrace.log
```

```
./mtrace-example
```

```
mtrace mtrace-example mtrace.log
```

```
Memory not freed:

```

```
>>> Valgrind I
```

1. memcheck: This is the default tool, and detects memory leaks and general misuse of memory
2. cachegrind: This calculates the processor cache hit rate
3. callgrind: This calculates the cost of each function call
4. helgrind: This highlights misuse of the Pthread API, potential deadlocks, and race conditions
5. DRD: This is another Pthread analysis tool
6. massif: This profiles usage of the heap and stack

```
>>> Valgrind II
```

To find our memory leak, we need to use the default memcheck tool, with the option `--leakcheck=full` to print out the lines where the leak was found:

```
valgrind --leak-check=full ./mtrace-example
```

```
